Stories Coffee — Executive Summary

POS Sales & Profitability Insights

Based on Stories Coffee POS exports (25 branches; 2025 + Jan 2026).

Problem statement

How can Stories Coffee use POS data to find the biggest revenue/profit drivers and decide what to fix first across branches and products?

Key findings (data-backed)

- Sales are concentrated: top 3 branches contribute 33.4% of total sales and top 5 contribute 45.4% (total sales: 983.1M).
- A few divisions drive most revenue: Cold Bar Section, Frozen Yoghurt, and Hot Bar Section account for ~77.0% of division revenue.
- Beverages outperform food on margin: beverages are 57.4% of revenue with ~77.2% margin vs food at ~63.1%.
- Data issues exist: ~28.0M cost is attached to items with zero recorded revenue (likely missing prices / POS setup). This is profit leakage and also breaks analytics.
- Seasonality is strong: average monthly sales peak in January and drop sharply in June (peak ~7× the low).

Recommendations (next 30–60 days)

- Replicate best practices from top branches (staffing, in-stock, bundles) into mid-tier branches.
- Protect the main revenue drivers: keep the top divisions fully in stock and reduce prep bottlenecks during peak months.
- Fix pricing/master-data immediately for items with cost but zero revenue (missing price, wrong item mapping, comps).
- Improve food profitability: review low-margin items, renegotiate inputs, and adjust prices or bundle to lift margin.
- Plan for seasonality: a June “dip playbook” (lighter labor + targeted promos) and a peak-month capacity plan.

Expected impact (order-of-magnitude)

- +1 percentage point margin improvement on FOOD revenue (~352.2M) adds ~3.5M profit if volume holds.
- Resolving zero-priced / zero-revenue items could recover up to the associated costs (~28.0M) depending on true selling prices.
- Reducing stockouts in the top divisions (≈77% of revenue) usually gives a bigger return than broad, unfocused changes.

Methodology (brief)

- Cleaned and standardized POS exports (names, missing/invalid rows; flagged suspicious prices).
- Aggregated revenue, cost, profit, and margin by branch, category, division, and product.
- Ranked top drivers and flagged anomalies (e.g., cost with zero revenue).
- Selected only the most decision-useful charts for executives.
